

Report of Examination of Alaska Salmon Stream.

Pybus Bay South Inlet Stream.

Date Examined Throughout season.

Location South Inlet Pybus Bay, Alaska.

Approximate Length. About 4 miles. Width 20 feet (average) Depth 15 inches. (Average)

Depth 15 inches (Average)

Condition and stage. About normal during first 10 days of July. Above normal for next 12 days, back to normal for remainder of month, and as there was no rain during August (up to 14th) of any consequence, stream was very low when "Humpy" run started.

Salmon run. Light.

Date and duration of run of each species. "Dog" salmon run had started first week in July and some still coming on 13th of August. "Humpy" run just starting 2nd week in August, but streams are so low that few could get up them.

Estimated number of each kind of salmon on spawning beds or in stream.  
"Dogs" 3,000. Humpies 100.

Former size of runs, etc. Was informed that there should have been about 12,000 to 15,000 in this stream.

Natural barriers, etc. A few natural barriers which could be removed.

Markers Markers placed about 500 yards from mouth of stream, one on each side of Inlet.

Remarks. There was very little fishing in this Inlet and <sup>if</sup> the "Humpy" run gets up creek the stream ought to average up quite well.

James J. Lewis, (signed)

Stream Watchman.
